

RESEARCH FOR RESULTS

Michigan Sugar Company Sugar Beets 2021

OVERVIEW: Introduction: This trial compares the standard application of in-furrow fertility in sugar beets with the in-furrow addition of SoilBiotics **Growth Boost** and **SB4400** and three foliar applications of SoilBiotics **Growth Supplement 30** and **SB Super Sweet** added to fungicide treatments.

LOCATION: Gilford, MI; Fairgrove, MI

TREATMENTS: **Treatment 1:** Control (Grey), **Treatment 2:** Add SoilBiotics **Growth Boost** and **SB4400** (Tan), **Treatment 3:** Add SoilBiotics **Growth Supplement 30** and **SB Super Sweet** (Yellow)

CV %			3.3	6.6	5.1	2.6	3.4	2.2	0.6

SUMMARY: The foliar application of SoilBiotics **Growth Supplement 30** and **SB Super Sweet** with fungicide (Yellow) resulted in greater sugar beet yields and increased RWSA (Recoverable White Sugar per Acre) versus the in-furrow only SoilBiotics treatment and in-furrow control. There was no significant difference between the in-furrow SoilBiotics treatment (Tan) and control (Grey).
