

# THE DIRT!

SOILBIOTICS COMPANY E-NEWSLETTER

AUGUST 2020

## August Beans

Timely foliar applications of SoilBiotics conventional and organic products has shown great results when applied between the R3 and R6 growth stages. You're looking for greater pod retention, pod fill and building test weight.

For conventional programs, we can provide a program of **Growth Supplement 30** with 0-0-29. For organic programs we would use **Growth Supplement 20** with 0-0-20. We recommend that you talk with your Soilbiotics representative or office staff for more information.

## Looking at Fall

### Overwintering N

We have all seen that most conventional fall nitrogen applications face large nitrification losses over the winter; in some instances, as much as 40%. We will be gearing up again to produce our **OS 46** product for customers wanting to put down N in strip-till applications. **OS 46** is a unique blend of high-quality 46-0-0 urea and SoilBiotics **4 – Ultra Boost** humic product that has the ability to remain in the soil for months and be there for the plants in the spring.

## Getting Ready for Winter Wheat

**Organic 1r - Seed Treatment** can be applied to organic or conventional winter wheat seed for increased germination and better stands. We have seen results of as many as 5k more live plants per acre.

## BAD SEEDS

Most of us have seen media coverage of people throughout the U.S. and other countries receiving unsolicited packages of seeds. USDA and state agencies have reported that these seeds are mostly various herb and flower seeds, however they warn not to plant them as there may be invasive species present. If you receive one of these packets, contact your local ag authorities for instructions on proper disposal.
